Lab Created Moissanite

What is Moissanite?

Pronounced moys-uh-nite, it is the name given to silicon carbide and its various crystalline polymorphs that naturally occur in nature. The chemical formula for this substance is SiC and it is classified as a rare mineral.

Discovered in 1893 by Dr. Henri Moissan, and later named for him, Moissanite traces its origins to a meteor crater where particles were found in Arizona. Naturally occurring Moissanite is found in very small quantities or particles in the earth and these moissanite crystals are not abundant in desired sizes appropriate for jewelry production.

Given the scarcity of the natural occurring material, over the years scientists worked hard to create Moissanite in a laboratory. With the help of technology, scientists finally succeeded in producing a stone with near-colorless properties that is durable and when cut properly yields a stone with incredible brilliance and fire.

Lab Created Moissanite is produced in a controlled environment that ensures consistency and quality standards are achieved. In this production method, Lab Created Moissanite is produced in large silicon carbide crystals. These crystals are then hand-cut and hand-faceted with specific techniques to produce a gemstone exhibiting optical properties of extraordinary brilliance and fire.

What is the difference between Pure & True?

	Color	6.5mm Round Price Comparison
MP Pure Light™	D-E-F colorless	\$189
MT True Light™	G-H-I near colorless	\$160
MB	J-K near colorless	\$105

Loose Stones

HISTORY: Discovered in 1893 by Dr. Henri Moissan, and later named for him, Moissanite traces its origins to a meteor crater where particles were found in Arizona. Given the scarcity of the natural occurring material, over the years scientists worked hard to create Moissanite in a laboratory. With the help of technology, scientists finally succeeded in producing a stone with near-colorless properties that is durable and yields incredible brilliance and fire.

SPECIES: Synthetic Silicon Carbide
HARDNESS: 9.25
TOUGHNESS: Excellent
ENHANCEMENT: SYN
REFRACTIVE INDEX: 2.65-2.69
OPTIC CHARACTER: DR
SPECIFIC GRAVITY: 3.21
PHENOMENA: None
QUALITY:
 QR: True Light™ G-H-I near colorless
 QP: Pure Light™ D-E-F colorless
REACTIONS
 Ultrasonic: Usually safe
 Steamer: Usually safe
 Heat: Color change, but will revert to original color after cooling. May cause damage under extreme temperatures.
 Chemicals: Bleach, Chlorine
SOURCES: Australia, Mexico, Brazil, USA (Idaho & Nevada)

CARE & HANDLING

May be cleaned with mild soap and water or wiped with a clean soft cloth. Avoid exposure to intense heat or light for long periods as this may cause fine fractures (known as crazing). Avoid rough surfaces that may cause scratches or harsh blows that may cause fractures or chips.

COMPARING PURE LIGHT™ & TRUE LIGHT™

STONE	CODE	COLOR	6.5MM ROUND PRICE COMPARE
Pure Light™	QP	D-E-F colorless	\$189
True Light™	QR	G-H-I near colorless	\$160

Pure Light™ and True Light™ Lab Created Moissanite arrives with a certificate of authenticity and limited lifetime warranty. Stones larger than 5.0mm are laser marked.

PURE LIGHT™ [QP]

Colorless and arrives in the D-E-F range.

TRUE LIGHT™ [QR]

Near colorless and arrives in the G-H-I range

How is Moissanite sold or measured?

Moissanite is sold by millimeter size and not carat weight. An approximate diamond equivalent weight may also be provided.
Moissanite is 13% less dense than diamond.

What is the color grading of Moissanite?

Colors of Lab Created Moissanite vary widely and are graded from D to K range on the jewelry industry diamond color grading scale.

Is Moissanite durable?

Yes, it is a very hard material. It ranks above 9 on the Mohs hardness scale making it the hardest mineral after a diamond.
It is resistant to chipping and abrasions. It is not indestructible. It can still be damaged by sharp and sudden blows.
Avoid wearing jewelry with Lab Created Moissanite stones during rough work, and do not expose it to chlorine or bleach.

Does more than one company manufacture Moissanite?

Yes, the patent in the United States that covered Moissanite in the creation of jewelry has expired.
More than one company is now making and reselling Lab Created Moissanite for the jewelry industry.

Is Moissanite a man-made or lab grown diamond?

No, Moissanite is not a man-made or a lab grown diamond. It is also not a diamond substitute or diamond simulant. Diamond is pure carbon.
Moissanite is a compound of silicon carbide. Naturally occurring Moissanite is extremely rare and found in sizes too small for jewelry.
Lab Created Moissanite that is found in the jewelry marketplace is laboratory created.

Codes

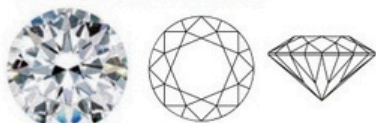

Code Definitions		
Symbol	Meaning	Description
C	Coating	The use of such surface enhancements as lacquering, enameling, inking, foiling or sputtering of films to improve appearance, provide color or add other special effects.
SC	Special Care	The "SC" symbol is used to designate those gemstones that require special care. If a gemstone enhancement is not permanent, appropriate disclosure is required. The symbol must be used in addition to the type of treatment.
SYN	Synthetic	Synthetic gemstones are usually identical in composition and in visual appearance to its naturally occurring counterparts. Synthetic gemstones have been created, not found or mined in nature.

Reactions Key	
Ultrasonic	Indicates if it is safe (or not) to use ultrasonic cleaning on the gem.
Steamer	Indicates if it is safe (or not) to use steam cleaning on the gem.
Heat	Indicates if it is safe (or not) to expose the gem to heating (i.e. during soldering for sizing or prong tipping).
Chemicals	Chemicals to avoid.

Properties Key	
Refractive Index (RI)	Measures how much slower light travels through a gemstone than in air. It is one of the most reliable gem properties. The stone's normal RI range is listed here along with the potential variance. Doubly refractive stones have two readings. The RI's given correspond to yellow light having a wave-length around 590 nm.
Optic Character	Indicates whether the stone is singly or doubly refractive (SR or DR). Also indicates when to expect anomalous double refraction (ADR) or an aggregate reaction (AGG).
Hardness	A material's resistance to scratching given in the Mohs hardness scale. This is a relative scale, with gems ranked as having the ability to scratch other gems that are ranked the same or lower.
Toughness	A material's resistance to breaking.
Specific Gravity	The ratio of the density of a substance compared to the density (mass of the same unit volume) of a reference substance. The typical value is listed, followed by either a single plus-or-minus figure or separate plus and minus variation figures. Specific Gravity can vary due to the presence of impurities or inclusions; however, it usually falls within a specific range.
Species	The mineral family of the gemstone. Each species has a physical (usually crystalline) structure and a well defined chemical composition. Most species include a number of different types of material with variations that are usually based on color and transparency; each of these is called a VARIETY.
Phenomena	The ability of a gem to display any unusual (rare) optical properties such as Asterism (stars), Chatoyancy (cat's eye), Color Change, Adularescence, etc.
Enhancement	The treatment type or enhancement procedure used on the gemstones.
